<tbody>
<tr>
<td>Grade</td>
<td>K-6</td>
</tr>
<tr>
<td>Content/theme</td>
<td>The relationship between bowl elements and how form affects function</td>
</tr>
</tbody>
</table>
| Objectives         | • Create simple slab bowls over hump/drape mold  
                    • Collect natural objects and experiment to make textures/impressions  
                    • Understand how texture changes from physical to visual texture  
                    • Understand how placement of texture creates different compositions  
                    • Understand how surface design changes feeling/use/value of object |
| Essential Questions| • How does your understanding of a leaf change when it is impressed into clay?  
                    • What adjectives can you use to describe how the natural object looks? What words describe how they feel? Are those two groups of words different?  
                    • How can you “read” a texture through visual marks? |
| Demos/Skills       | Rolling slab  
                    Cutting slab  
                    Impressing objects  
                    Draping slab over form  
                    Cutting away excess clay  
                    Adding foot (optional)  
                    Brushing bisque with underglaze to highlight impression |
| Vocabulary         | Slab  
                    Hump/drape mold  
                    Impress  
                    Underglaze  
                    Texture  
                    Marks  
                    Foot  
                    Rim  
                    Elements and Principles of Design |
| Artist/Culture     | Historical examples:  
                    Art Deco/Nouveau pottery, Grueby Co. & Encaustic Tile Co.  
                    Palissy Ware  
                    Majolica, Minton Co. & Wedgewood  
                    Contemporary examples:  
                    Richard Vincent, Minnesota  
                    Ellen Grenadier, Massachusetts |
| References         | Clay (2 lbs. per student)  
                    Rolling pins  
                    Small brayers (to help press clay slab over hump bowl) - optional  
                    Newspaper/canvas/surface for rolling clay that won’t stick  
                    Soup-size, paper picnic bowls  
                    Fettling knife/pin tools (cutting slabs & scoring)  
                    Underglaze & glaze for finishing surface  
                    Small sponges  
                    Clean up sponges  
                    Plastic for slow drying |

<tbody>
<tr>
<td>1</td>
<td>Nature walk &amp; collection of natural objects (Leaves, grass, small sticks, pebbles, bark, pods, etc. Look for flat objects. Some height is ok, but if too large will crack slab)</td>
<td>Go on a walk around the school Pick up 3-5 natural objects that will create texture or impression in clay</td>
<td>• What kind of textures or shapes do you notice when you are walking around? • How do they feel when you rub your hand over your object? • What kind of impression do you think it will make in clay?</td>
</tr>
<tr>
<td>2</td>
<td>Experiment with impressions/texture (optional)</td>
<td>1. Roll slab 2. Press objects into clay, experimenting with pressure, placement, rhythm 3. Ball up clay and return to bag (add a little water to rehydrate) 4. * Note: This step could be done in Play-doh if re-working clay is too much trouble</td>
<td>• When you rubbed your hand over your object, describe the texture you felt. • When you look at the marks your object made in the clay, can you imagine how it feels? How? • What does a texture look like when it is translated into clay? • How does the impression change when you push into the clay forcefully? • What does it look like when you group a lot of impressions close together?</td>
</tr>
<tr>
<td>Construction</td>
<td>Activity</td>
<td>Steps</td>
<td>Dialogue</td>
</tr>
<tr>
<td>3</td>
<td>Roll clay slabs</td>
<td>1. Roll slab, trying to make it round and about 2-3 inches larger than the rim of the paper bowl 2. Focus on even rolling (can use 2 flat 1/2&quot; sticks as guides)</td>
<td>• What helps in rolling an even slab? • Is it better to do small tiny rolls or large rolls? • What part of your hand should you use? • Does turning the slab help? Why?</td>
</tr>
<tr>
<td>4</td>
<td>Impress found objects</td>
<td>1. Lay found objects on table 2. Place slab over objects 3. Gently roll slab on top of objects 4. * Note: Could also lay objects on top of slab, layer with piece of canvas, and roll on top of canvas to impress objects</td>
<td>• How are you going to place your objects? Overlap them? Line them up? Place them near middle? Near the edge? • Are you going to use more than one object? How will you decide which object to use where? • How closely will you impress them? • How will your placement emphasize certain parts of the bowl form? Organize around the rim or travel over the edge?</td>
</tr>
<tr>
<td>5</td>
<td>Cut slab in a circle, using upside down bowl as template</td>
<td>Place paper bowl on top of slab, keeping found objects in place Cut around perimeter of bowl using fettling knife or pin tool</td>
<td>• Do you want to make impressions on the exterior of your bowl too? • Will you impress the outside the same way as you did on the interior or try a different approach? • How can you use impressions to emphasize different parts of the bowl exterior?</td>
</tr>
<tr>
<td>6</td>
<td>Drape bowl</td>
<td>1. Carefully drape textured slab over bowl form 2. Press clay down gently to conform to shape 3. Cut away clay to form a rim</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Rim</td>
<td>4. Cover bowl with plastic and let sit overnight 5. Flip bowl over and remove found objects on interior 6. Finish rim</td>
<td>• Note: If you will not see student in a while, completely wrap the piece in plastic to keep from drying out • What do you need to do to make the rim look finished? • Should the rim turn inward or outwards? How thick should it be?</td>
</tr>
<tr>
<td></td>
<td>Bisque</td>
<td></td>
<td></td>

</thead>
</table>
| Slip     | Colored liquid clay that is decoratively applied to the surface of a pot | • Slip trailing  
• Mishima/inlay  
• Paper resist/stencils  
• Sgraffito | leather hard | • underglazes  
• washes/stains | Commercial or individually mixed | Changes the color of the pot; used with many decorative techniques | Formulated for low, mid, and high fire. Need to use slip that corresponds with clay body and firing temp. |
| Engobe   | Similar to slip but has more flux (melter). “Engobe” often used as synonym of “slip.” | • Same applications as slip | | | | |
| Underglaze | Can be used under clear glaze; can be used like like slip; can be used on top of texture and wiped off | • Brush on wipe-off stamps/impressions  
• Paper resist/stencils  
• Brush onto bisque surface (under the glaze) | leather hard, bone dry, or bisque | • washes/stains  
• slip | Commercial | Consistent; commercially available; bright colors | All work at low-fire. Most at mid-fire. Some darker colors work at high-fire but need to be tested. |
| Washes/Stains | Metallic oxide or Mason stain combined with flux + water | • Brush on wipe-off stamps/impressions  
• Brush on top of raw glaze (over the glaze)  
• Brush onto bisque surface (under the glaze) | bisque; can be applied to bone dry work but takes more skill | • slip  
• underglazes | Individually mixed in 1:1 ratio of Flux:oxide/Mason stain + water | emphasizes texture/impressions; strong color that will impact glaze color | Will work at any temperature and is not temperature specific. |
| Terra Sigillata | Finest particles of clay applied in layers and burnished to get glossy sheen | Good for raku, pit firing | bone dry | • slip can be applied over terra sigillata so glossy/matte contrast like Maria Martinez | Individually mixed | lightly seals surface; glossy sheen and doesn’t cover up clay; historic connection | Low-fire only |
Decorative Surface Material Definitions

Slip/Engobe

Material: A homogenous mixture of clay and water. Decorative slip differs from slurry used for joining pieces or produced in the process of throwing. Decorative slips are usually mixed from a recipe and have more flux (melter) than a slurry-slip which is just clay + water. They also often have a colorant added. “Engobe” is often used synonymously with “slip,” but technically, an engobe has more flux than a slip as sits between a slip and a glaze. Slip recipes are designed for specific temperatures (low, mid, high-fire) so that they melt in-unison with the clay body. Therefore, it is important to make sure you choose a slip that corresponds to your clay body and firing temperature.

Source: Slips are commercially available pre-mixed or in powdered format. Casting slips are different from decorative slips in they have a deflocculant added which makes the slip behave differently. While it is possible to use a casting slip to decorate, it can cause problems, and it is probably best to purchase only a true decorative slip for classroom use. It is much cheaper to mix a slip by measuring recipe of dry chemicals than to purchase it pre-mixed. This is easy if you have a gram scale, and there are many recipes online for decorative slips at every temperature.

Mixing: Slips can be the same color as a clay body or they can be colored with oxides or Mason Stains to create a color that contrasts with the clay body. The most often used slip is a white slip to cover a red, low-fire, terra-cotta clay body in order to get a white ground. To mix a slip, measure ingredients, add water, sieve, let stand for 24 hours for full water saturation. To mix colored slips, start with a white slip recipe and add Mason Stains or metallic oxides to the slip base. To get light pastel color, add 5% Mason Stains. To get a more saturated color, add up to 20% Mason Stains. Metallic oxides can also be added to color slip, however, the percentages vary from oxide to oxide. In general, oxides are much stronger than Mason Stains and should be used from 2-6% in slips.

Use: Slips are used with a variety of decorative techniques, including sgraffito, slip trailing, paper resist/stenciling, and inlay/mishima.

Application: Slip is usually applied to leather-hard ware before it is bisque fired. There are slips recipes designed to be applied to bisque ware, but they have to be specially formulated for shrinkage. Common examples of these are “flashing slips” applied to bisque ware for wood firing.

Artists often manipulate the consistency of slip through adding a deflocculant or flocculant. This will affect the look of the slip after it is applied. A few drops of saturated solution of epsom salts and water can be added to a slip to flocculate or thicken it. Darvan 7 or Sodium Silicate can be added to a slip recipe when it is initially mixed to deflocculate it or make it appear fluid without adding a lot of water.

Wash/Stain

Material: A solution of a metal oxide and water. Often a flux is added to this mixture to help with melting and adhering to clay body.

Source: Not commercially available, but easy to mix by hand.

Mixing: Mixed by measuring 50/50 by volume (1 tsp./1 tsp.) of metallic oxide/Mason Stain to flux. For a flux, most people use Gerstley Borate, Gillespie Borate or Frit 3124. Water is added to the powdered chemicals until it is fluid and brushable.

Use: Can be used to highlight impressed designs and create color contrast. Wash/stain is brushed on surface and sponged off so it remains only in recessed areas. Also used in combination with glazes to create color variation or used with brush to paint an image. Washes/stains are very strong concentrations of colorants and in many ways can be used as a very strong underglaze. Washes/stains can also be used over glazes. A common technique is brushing a rutile stain over Tenmoku (iron saturate glaze) to create an amber line.

Application: May be used under or over a glaze. Usually used on bisque ware but can be used on green ware if careful. Washes are very strong and concentrated. If used too heavily, all washes/stains will look black regardless of the color. Because the metallic oxides are very concentrated, you should always use gloves when handling washes/stains.
**Underglaze**

*Material:* Underglazes are an oxide(s) combined with a small amount of flux (melter) that binds them to the clay body and integrates them with the glaze. Underglazes also have gums added to them which make them very brushable. Underglazes gain their full color with the ‘wetting’ action of the covering glaze.

*Source:* Commercially available. Purchased wet-mixed in 4 or 16 oz. bottles from ceramic supplier.

*Use:* Underglazes are used for their intensity, a wide range of color, and stability of that color. They are most often used as low temperatures (cone 04), but some colors (darker colors with cobalt, chrome, copper as dominant oxide) are still effective at cone 10 temperatures. Underglazes are used much like slips to add color to a ceramic surface. They can also be used instead of stains/washes to highlight impressed designs. They can also be used in a painterly way and combined with other colors (although it is often hard to tell the intensity and hue of the color before firing).

*Application:* Underglaze can be applied to pieces before or after bisque firing. They should be applied under a glaze (not on top). They are a very uniform and stable decorative material and the raw color you see is dull but similar to the fired color. Often, several layers of brushed underglaze are needed to get an opaque and uniform color. Underglazes are often used in classroom settings because they are commercially available, easy to use, come in a broad range of colors, provide an intense saturated color, can be applied to both green and bisque ware, and are easy to clean up. However, they are expensive!!

**Terra Sigillata**

*Material:* A liquid suspension of the finest particles of clay that is applied to a bone dry pot. If polished or burnished just after application, may give a high gloss. Acts as a seal or porous clay, making it less prone to absorb moisture. All ancient Greek red-black pottery, Roman red wares, and most Native American pieces were finished with terra sigillata, without the use of glaze. Many contemporary potters who work in earthenware use terra sigillata to seal the foot of their pots.

*Source:* Individually mixed. Not available commercial. To mix = deflocculant + wet + dry materials, blunge, let sit for 2-3 days, siphon off fine-particle mixture. The color of the terra sigillata is determined by the color of the clay used. Most terra sigillata are red, buff or white. However, white terra sigillata (mixed from EPK or OM4 ball clay) can be tinted by adding Mason Stains.

*Use:* Does not make a piece food safe nor vitreous. Does not work above cone 04 since the molecular structure changes at high fire, destroying the glossy sheen. Does not work under a glaze but will be dissolved by glaze over it. Terra sigillata works very well with pit/sawdust firing techniques.

*Application:* Apply to bone dry clay. Usually 3+ coats are needed. Often burnished with a rock, spoon or cloth to help get sheen. Burns out at cone 04 and above.
